

Selenium IDE Reporting & Debugging Guide

Practical implementation guide for execution logs, screenshots, and troubleshooting

Task 1 Record Search & Generate Test Summary Report on Flipkart

Test Script Configuration:

Command	Target	Value
open	https://www.flipkart.com	
set window size	1280x800	
type	name=q	Wireless Earbuds
sendKeys	name=q	\${KEY_ENTER}
wait for element visible	css=div[data-id]	10000
assert element present	css=div[data-id]	

Generating & Saving the Execution Report:

- Click the **Play** icon to run the test suite.
- Once the execution completes, locate the **Log** tab in the bottom panel of Selenium IDE.
- Click the **Download Log** icon (or right-click inside the log pane and select **Save Logs As...**).
- Save the generated text log as `Flipkart_Search_Execution_Report.txt`.

Task 2 Capture Manual Screenshot for Failed Zomato Search

1. Simulating the Scenario:

During a Zomato search automation, an invalid locator (e.g., `css=div.non_existent_search_result`) causes the test to hit a timeout and fail.

2. Manual Capture Workflow:

- When the test runner stops at the failed step, leave the automated browser window open.
- Capture the full window showing both the browser error state and the highlighted red line in Selenium IDE:
 - **Windows:** Press `PrtScn` or `Win + Shift + S`.
 - **macOS:** Press `Cmd + Shift + 4`.
- Save the image file using a standardized naming convention indicating the failed step:
`Zomato_Search_Failed_Step_WaitVisible_RestaurantList.png`.

Task 3 Automated Screenshot Command in Myntra Shopping Flow

Test Script with Built-in Screenshot Command:

Command	Target	Value
open	https://www.myntra.com	
click	xpath=//div[contains(text(),'ADD TO BAG')]	
wait for element visible	css=span.desktop-badge	5000
capture screenshot	Myntra_AddToCart_Success.png	

Verifying File Location:

1. When `capture screenshot` executes, Selenium IDE triggers a browser download prompt or automatically saves the image depending on your extension settings.
2. Open your system's default **Downloads** directory (or the designated IDE working directory).
3. Confirm that `Myntra_AddToCart_Success.png` is generated and correctly captures the updated shopping bag badge.

Task 4 Debugging a Failed Search Test on BookMyShow

Debugging Workflow:

1. Open the failing BookMyShow search test suite in Selenium IDE.
2. Set a **Breakpoint** on the search step by right-clicking the `type` or `click` command and selecting **Toggle Breakpoint**.
3. Click **Run Current Test**. Execution will pause right before the failing step.
4. Use the **Step Over** button to execute commands line-by-line and observe the browser DOM state in real time.

Root Cause & Fix Explanation:

- **Root Cause Identified:** Execution paused at line 4 (`click` | `css=a.movie-card` |). The command failed with an `ElementNotInteractableException` because the location selection modal overlaid the entire page before search results could render.
- **Fix Applied:** Inserted a `wait for element visible` command targeting the location modal, followed by a `click` command to close/select the city before searching.

```
[Added] wait for element visible | css=div.location-modal | 5000
[Added] click                    | xpath=//span[text()='Mumbai'] |
[Fixed] type                    | css=input[placeholder*='Search'] | Inception
```
